# Acknowledgements

This report has been produced by the European Topic Centre on Human health and the Environment (ETC HE) in close cooperation with the EEA.

The ETC task manager was Jaume Targa, closely assisted by María Colina and Joana Soares, and the EEA project manager was Alberto González Ortiz closely assisted by Silvia Monge and Ragnhildur Finnbjornsdottir.

Additional EEA contributors were Artur Gsella. Additional ETC HE contributors were Michel Houssiau (under 4sfera Innova), Jaume Archilés (4sfera Innova) and Rune Ødegård (NILU).

Thanks are due to the air quality data suppliers in the reporting countries for collecting and providing the data on which this report is based.

### 1 Summary

The 2024 Status report of air quality in Europe presents summarized information on the air quality data for the protection of health reported in the previous years. The reported 2024 monitoring data used in this analysis was reported as up-to-date (UTD) data, prior to final quality control and validated data reporting by the countries (1). It provides information on the following pollutants, regulated by the Ambient Air Quality Directives (AAQD) (EU, 2008, 2024)

- PM<sub>10</sub>: Particulate matter with a diameter of 10 μm or less
- PM<sub>2.5</sub>: Particulate matter with a diameter of 2.5 μm or less
- O<sub>3</sub>: Tropospheric ozone
- NO<sub>2</sub>: Nitrogen dioxide
- SO<sub>2</sub>: Sulphur dioxide

It also offers a comparison with the situation in previous years. For those years, validated data are considered.

Data included in this report was received by 19 February 2025 from the reporting countries. By that date the reporting status of 2024 up-to-date data is summarized in Figure 1, where a green box indicates that the referred pollutant was reported by the referred country and a grey box indicates the contrary (that the referred pollutant was not reported by the referred country). Please see editorial notes at the end of this Chapter on additional information on the data used. The number of stations by country reporting each pollutant, with the minimum data coverage for at least one of the aggregations used in the report, is also included in Figure 1, while Table 3 in the Annex summarizes the number of stations, with the minimum data coverage for at least one of the aggregations used in the report, at different country aggregations. Data from stations that do not fulfil the criteria from Box 1.1 are excluded from this report. Please be aware that the number of stations presented in Figure 1 and Table 3, that corresponds to all reported stations fulfilling the minimum data coverage criteria for at least one of the aggregations used in the report, may be different to the one presented in the corresponding boxplots, as there could be some stations not fulfilling the minimum data coverage criteria for the corresponding aggregation.

The countries included in this report and that, therefore, appear in Figure 1, are those with the obligation to report data under the AAQD or that have voluntary reported data. These countries are the EU-27 (Austria, Belgium, Bulgaria, Croatia, Cyprus, Czechia, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain and Sweden); the five other member countries of the EEA (Iceland, Liechtenstein, Norway, Switzerland and Türkiye) that, together with the EU-27 form the EEA-32; the six EEA's cooperating countries from the Western Balkans (Albania, Bosnia and Herzegovina, Kosovo under UN Security Council Resolution 1244/99, Montenegro, North Macedonia and Serbia) that, together with the EEA-32 form the EEA-38; and the voluntary reporting country of Andorra.

The air quality data are stored at the EEA's e-reporting database (<sup>2</sup>). Therefore, this is the source for all maps and figures in the report. UTD data is stored temporarily until it is replaced by CDR data.

### 1.1 Particulate matter

For PM<sub>10</sub>, concentrations above the EU daily limit value (50  $\mu$ g/m<sup>3</sup>) were registered at 7 % of the reporting stations. These stations were in 13 countries in EU-27 and in 2 other reporting countries. For PM<sub>2.5</sub>, concentrations above the EU annual limit value (25  $\mu$ g/m<sup>3</sup>) were registered at 0.6 % of the reporting stations. These stations were in 2 countries in EU-27 and in 1 other reporting countries.

The long-term World Health Organization air quality guideline (WHO AQG) level for  $PM_{10}$  (15  $\mu g/m^3$ ) was exceeded at 59 % of the stations in 27 countries of the EU-27 and 4 other reporting countries. The long-term WHO AQG level for  $PM_{2.5}$  (5  $\mu g/m^3$ ) was exceeded at 93 % of the stations located in 25 countries of the EU-27 and 6 other reporting countries.

### 1.2 Ozone

13 % of stations registered concentrations above the EU target value for  $O_3$  (120  $\mu g/m^3$ ) for the protection of human health. These stations were located in 16 countries of the EU-27 and 3 other reporting countries. The long-term EU objective (120  $\mu g/m^3$ ) was met in only 22 % of the stations. The short-term WHO AQG level for  $O_3$  (100  $\mu g/m^3$ ) was exceeded in 92 % of all the reporting stations, and concentrations above the long-term WHO AQG level for  $O_3$  (60  $\mu g/m^3$ ) were registered in 98 % of all reporting stations.

### 1.3 Nitrogen dioxide

Around 1 % of all the reporting stations recorded concentrations above the EU annual limit value for  $NO_2$  (40  $\mu$ g/m³). These stations were located in 6 countries of the EU-27 and 1 other reporting country. 96 % of concentrations above this limit value were observed at traffic stations.

On the contrary, 65 % of stations, located in 27 countries of the EU-27 and 7 other reporting countries reported concentrations above the WHO AQG level of 10  $\mu g/m^3$ .

### 1.4 Sulphur dioxide

For  $SO_2$ , regarding the EU daily limit value (125  $\mu g/m^3$ ), concentrations above were registered at 0.4 % of the reporting stations. These stations were in 2 country of the EU-27 and 2 other reporting countries . On the other hand, concerning the daily WHO AQG level (40  $\mu g/m^3$ ), 3 %

<sup>&</sup>lt;sup>2</sup>https://discomap.eea.europa.eu/App/AQViewer/index.html?fqn=Airquality\_Dissem.b2g,AirQualityStatistics

of all reporting  $SO_2$  stations measured  $SO_2$  concentrations above. These stations were located in 10 countries of the EU-27 and 2 other reporting countries .

### 1.5 Editorial note

Values in Table 4 in Annex 1 are considered outliers and were not taken into account for the analysis presented in this report.

On 20 November 2024, the revised Directive (EU) 2024/2881 (EU, 2024) on ambient air quality and cleaner air for Europe was published and it entered into force on 10 December 2024. It sets new or revised air quality standards to be reached by 1 January 2030. The main analysis in this report is done against the AQ standards defined in the 2004 and 2008 AAQD (EU, 2008, 2024), which are the ones currently applicable. Annex 2 benchmarks the situation in year 2024 with respect to some of the new and/or revised AQ standards, as an analysis of the 'distance to target' from the 2024 status.

Once the production of the report was closed, North Macedonia informed the EEA that some  $SO_2$  data from station MK0044A Kavadarci were wrongly reported. As a result of removing those wrong data, concentrations in that station would not be above the  $SO_2$  daily limit value.

### 2 Introduction

The 2024 Status report of air quality in Europe presents summarized information on the air quality data reported up to 2024. The 2024 data was reported as up-to-date (UTD) data in a continuous basis prior to final quality control and official reporting of validated data by the countries, which will be done under the 2025 September reporting cycle (validated assessment data for 2024, deadline of submission 30 September 2025). This report aims at informing on the current status of ambient air quality in Europe, based on the most updated data available for the analysis of a complete calendar year. Furthermore, it informs on progress towards meeting the air quality standards established for the protection of health in the Ambient Air Quality Directives (EU, 2004, 2008) (Table 1) and the World Health Organization air quality guideline levels (WHO, 2000, 2006, 2021) (Table 2)(3).

This report builds on the former EEA "Air quality in Europe report" (EEA, 2020) content, figures and maps regarding the status of monitored air quality in Europe. The report focuses on the analysis of the main pollutants, to allow a meaningful preliminary analysis of their concentration status in Europe. It provides:

- a European overview of the monitoring stations that reported UTD 2024 data, and of their concentrations in relation to the EU legal standards set in the 2008 EU Ambient Air Quality Directive (EU, 2008) and WHO AQG levels for each pollutant;
- a map with the 2024 UTD concentrations at station level for each pollutant;
- a boxplot graph summarizing for each country the range of concentrations (highlighting the lowest, highest, average and the 25 and 75 percentiles) for PM<sub>10</sub>, PM<sub>2.5</sub>, NO<sub>2</sub> and O<sub>3</sub>.

### Furthermore, it provides:

 maps with the situation at station level for the previous three years (using validated data). In this way, any significant change in the spatial distribution of the values above the set thresholds in the legends can be observed (assuming the UTD stations dataset is complete);

 $<sup>^3</sup>$ Nevertheless, in this report the following standards and guideline levels are not analysed: exposure concentration obligation and national exposure reduction target for PM<sub>2.5</sub>, information and alert thresholds for O<sub>3</sub>, alert threshold for NO<sub>2</sub>, annual target value for BaP, alert threshold for SO<sub>2</sub>, limit value for CO maximum daily 8-hour mean, annual limit value for C<sub>6</sub>H<sub>6</sub>, annual limit value for Pb, target value for As, target value for Cd, and target value for Ni in Table 1; and hourly air quality guideline level for NO<sub>2</sub>, reference level for annual mean of BaP, 10 minutes air quality guideline level for SO<sub>2</sub>, air quality guideline level for CO, reference level for annual mean of C<sub>6</sub>H<sub>6</sub>, air quality guideline level for Pb, reference level for annual mean of As, air quality guideline level for Cd, and reference level for annual mean of Ni in Table 2.

 heatmaps with the evolution of the mean and the maximum measured concentrations at country level since 2000 (or since when available, using validated data for all years up to 2023).

Please be aware that the number of stations can vary once the validated dataset for 2024 is received by 30 September 2025. In some figures like the boxplots, the final order of the countries may vary once the validated data are submitted.

Table 1: Air quality standards for the protection of health, as given in the EU 2004 and 2008 Ambient Air Quality Directives

Pollutant	Averaging period	Legal nature and concentration	Comments
PM <sub>10</sub>	1 day	Limit value: 50 μg/m <sup>3</sup>	Not to be exceeded on more than 35 days per
			year
	Calendar year	Limit value: 40 μg/m <sup>3</sup>	
PM <sub>2.5</sub>	Calendar year	Limit value: 25 µg/m <sup>3</sup>	Stage 1
		Indicative limit value: 20 μg/m <sup>3</sup>	Stage 2: indicative limit value to be reviewed by
			the Commission in 2013. It remained unchanged
			after that revision
		Exposure concentration	Average Exposure Indicator (AEI) (a) in 2015
		obligation: 20 μg/m <sup>3</sup>	(2013-2015 average)
		National Exposure reduction target:	AEI ( <sup>a</sup> ) in 2020, the percentage reduction
		0-20 percentage reduction in exposure	depends on the initial AEI
O <sub>3</sub>	Maximum daily	Target value: 120 μg/m <sup>3</sup>	Not to be exceeded on more than 25 days/year,
	8-hour mean		averaged over 3 years (b)
		Long term objective: 120 μg/m <sup>3</sup>	
	1 hour	Information threshold: 180 μg/m <sup>3</sup>	
		Alert threshold: 240 $\mu\text{g}/\text{m}^3$	
NO <sub>2</sub>	1 hour	Limit value: 200 μg/m <sup>3</sup>	Not to be exceeded on more than 18 hours per
			year
		Alert threshold: 400 μg/m <sup>3</sup>	To be measured over 3 consecutive hours over
			100 km <sup>2</sup> or an entire zone
	Calendar year	Limit value: 40 μg/m <sup>3</sup>	
BaP	Calendar year	Target value: 1 ng/m <sup>3</sup>	Measured as content in PM <sub>10</sub>
SO <sub>2</sub>	1 hour	Limit value: 350 μg/m <sup>3</sup>	Not to be exceeded on more than 24 hours per
			year
		Alert threshold: 500 μg/m <sup>3</sup>	To be measured over 3 consecutive hours over
			100 km <sup>2</sup> or an entire zone
	1 day	Limit value: 125 μg/m <sup>3</sup>	Not to be exceeded on more than 3 days per year
СО	Maximum daily	Limit value: 10 mg/m <sup>3</sup>	
	8-hour mean		
C <sub>6</sub> H <sub>6</sub>	Calendar year	Limit value: 5 μg/m <sup>3</sup>	
Pb	Calendar year	Limit value: 0.5 μg/m <sup>3</sup>	Measured as content in PM <sub>10</sub>
As	Calendar year	Target value: 6 ng/m <sup>3</sup>	Measured as content in PM <sub>10</sub>
Cd	Calendar year	Target value: 5 ng/m <sup>3</sup>	Measured as content in PM <sub>10</sub>
Ni	Calendar year	Target value: 20 ng/m <sup>3</sup>	Measured as content in PM <sub>10</sub>

### Notes:

### Sources:

EU (2004, 2008).

<sup>&</sup>lt;sup>a</sup> AEI: based upon measurements in urban background locations established for this purpose by the Member States, assessed as a 3-year running annual mean.

<sup>&</sup>lt;sup>b</sup> In the context of this report, only the maximum daily 8-hour means in 2024 are considered, so no average over the period 2022 - 2024 is presented.

Table 2: WHO air quality guideline (AQG) levels and estimated reference levels (RL) (a)

Pollutant	Averaging period	AQG	RL	Comments
PM <sub>10</sub>	1 day	$45\mu g/m^3$		99th percentile (3-4 exceedance days per
				year). Updated 2021 guideline

### Notes:

### Sources:

WHO (2000, 2006, 2021).

<sup>&</sup>lt;sup>a</sup> As WHO has not set an AQG level for BaP, C<sub>6</sub>H<sub>6</sub>, As and Ni, the RL was estimated assuming an acceptable risk of additional lifetime cancer risk of approximately 1 in 100 000.

<sup>&</sup>lt;sup>b</sup> Average of daily maximum 8-hour mean concentration in the six consecutive months with the highest six-month running average O<sub>3</sub> concentration.

<sup>&</sup>lt;sup>c</sup> AQG set to prevent any further increase of Cd in agricultural soil, likely to increase the dietary intake of future generations.

### Box 1.1 Classification of monitoring stations and criteria used for the assessment

Fixed sampling points in Europe are situated at different types of stations following rules for macroand micro-scale siting. Briefly, depending on the predominant emission sources, stations are classified as follows:

- traffic stations: located in close proximity to a single major road;
- industrial stations: located in close proximity to an industrial area or an industrial source;
- background stations: where pollution levels are representative of the average exposure of the general population or vegetation.

Depending on the distribution/density of buildings, the area surrounding the station is classified as follows:

- urban: continuously built-up urban area;
- suburban: largely built-up urban area;
- rural: all other areas.

For the pollutants considered in this report, monitoring stations have to fulfil the criterion of reporting more than 75 % of valid data out of all the possible data in a year to be included in this assessment. Reporting stations not fulfilling the minimum data coverage could be found at the Annual AQ statistics table.

Measurement data are rounded following the general recommendations under (EU, 2011). The number of considered decimals are indicated in the legend of the corresponding maps.

The assessments, in the cases of PM and  $SO_2$ , do not account for the fact that the Ambient Air Quality Directive (EU, 2008) provides Member States with the possibility of subtracting contributions to the measured concentrations from natural sources and winter road sanding/salting under specific circumstances.

## 3 Status of particulate matter ambient air concentrations

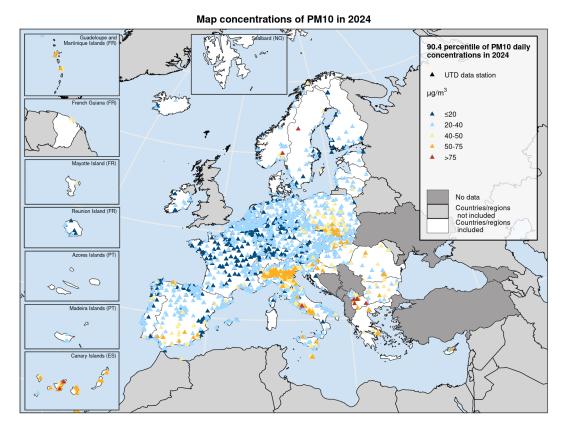

### 3.1 Status of PM<sub>10</sub> concentrations

The EEA received  $PM_{10}$  data for 2024, with sufficient valid measurements from 2508 stations for the calculation of annual mean concentrations and from 2503 stations in relation to the daily limit value. The stations were located in all the reporting countries shown in Figure 1.

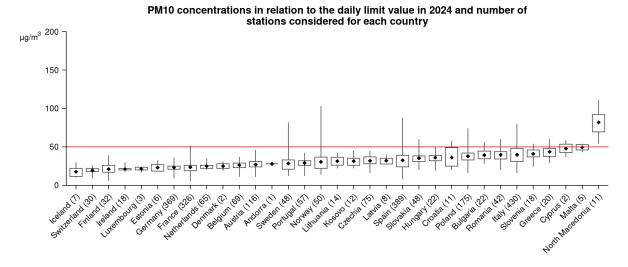

Thirteen countries in EU-27, and two other reporting countries reported PM $_{10}$  concentrations above the EU daily limit value of 50  $\mu$ g/m $^3$  (Figure 2). This was the case for 7 % (174) of reporting stations. In total, 97 % of those stations were either urban (77 %) or suburban (20 %). The stricter value of the WHO AQG level for PM $_{10}$  daily mean (45  $\mu$ g/m $^3$ ) was exceeded at 59 % (1468) of the stations in all the reporting countries, except in Denmark, Luxembourg and Switzerland(Figure 8).

Concentrations above the  $PM_{10}$  annual limit value (40  $\mu$ g/m³) were monitored in 0.6 % (14 stations) of all the reporting stations, located in 2 countries in EU-27, and 2 other reporting countries. The stricter value of the WHO AQG level for  $PM_{10}$  annual mean (15  $\mu$ g/m³) was exceeded at 59 % (1472) of the stations in all the reporting countries, except in Andorra and Switzerland(Figure 5).

Figure 2: UTD Map and boxplot of PM<sub>10</sub> concentrations in 2024 - daily limit value

Note: Observed concentrations of PM10 in 2024. The possibility of subtracting contributions to the measured concentrations from natural sources and winter road sanding/salting has not been considered. The map shows the 90.4 percentile of the PM10 daily mean concentrations, representing the 36th highest value in a complete series. It is related to the PM10 daily limit value, allowing 35 exceedances of the 50 µg/m³ threshold over 1 year. The last two colour categories indicate stations with concentrations above this daily limit value. Only stations with more than 75 % of valid data have been included in the map.

Note: The graph is based, for each country, on the 90.4 percentile of daily mean concentration values corresponding to the 36th highest daily mean in a complete time series. For each country, the number of stations considered for 2024 (in brackets) are given. The boxplot represents the lowest (bottom of the whisker), highest (top of the whisker) and average (black dot) 90.4 percentile values (in µg/m³). The rectangles mark the 25th and 75th percentiles. At 25 % of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations are above the 75th percentile. The daily limit value set by EU legislation is marked by the horizontal line. The graph should be read in relation to the above map, as a country's situation depends on the number of stations considered.

Figure 3 shows the maps of the 90.4 percentile of  $PM_{10}$  daily mean concentrations (equivalent to the  $PM_{10}$  daily limit value) for four years. In this way, any significant change in the spatial

distribution of the values above the set thresholds in the legends can be observed. Note that only the last year's map (2024) is based on UTD data, while the previous three years are based on officially reported validated data (CDR).

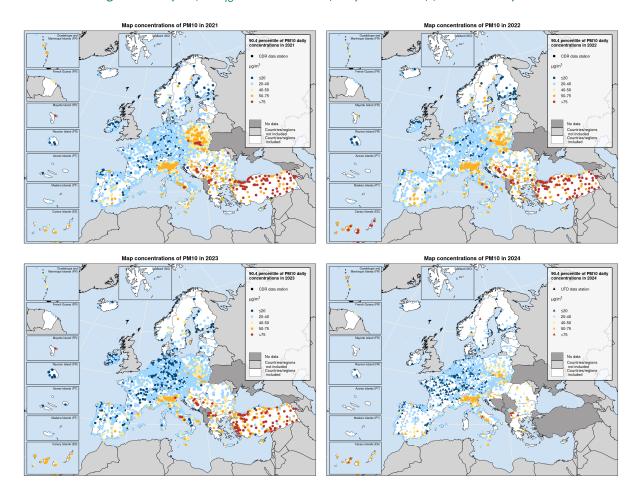

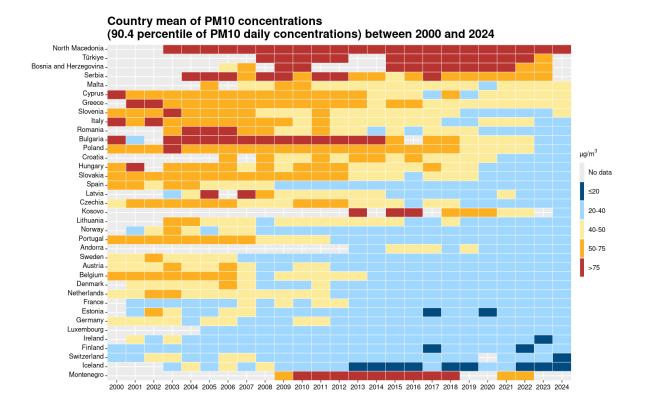

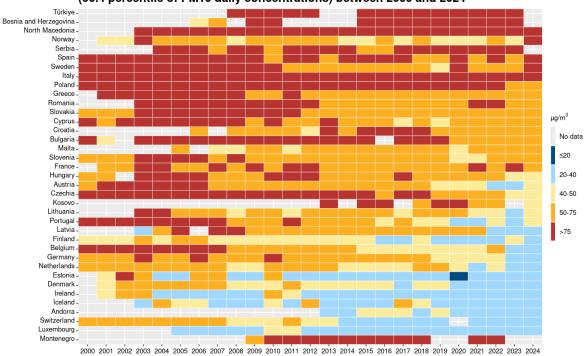

Figure 3: Maps of PM<sub>10</sub> concentrations (daily limit value) for the last 4 years

Heatmaps with the evolution from 2000 of the mean (top) and the maximum (bottom) 90.4 percentile of  $PM_{10}$  daily mean concentrations at country level are shown in figure 4. In this way, the evolution along years of the average and maximum measured concentration levels can be seen for each country. Note that meteorological variability has a considerable impact on year-to-year changes in ambient air concentrations of air pollutants (EEA, 2020), and the last year (2024) is based on UTD data, while the previous years are based on officially reported validated data.

Figure 4: Evolution of mean (top) and maximum (bottom) 90.4 percentile of PM<sub>10</sub> daily mean concentrations (daily limit value) per country from 2000

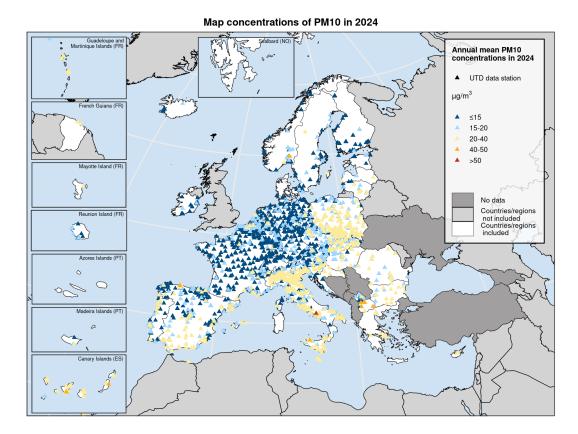

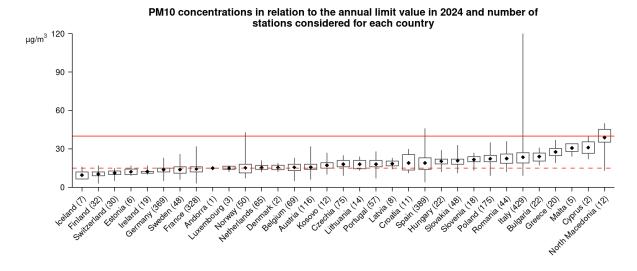

Note: It is important to note that the figure is not based on a consistent set of stations. The number, location and classification of the stations included may vary from year to year.

Figure 5: UTD Map and boxplot of  $PM_{10}$  concentrations in 2024 - annual limit value

Note: Observed concentrations of PM10 in 2024. The possibility of subtracting contributions to the measured concentrations from natural sources and winter road sanding/salting has not been considered. The last two colour categories indicate stations reporting concentrations above the EU annual limit value (40 µg/m³). The first colour category indicate stations reporting values below the WHO AQG level for PM10 (15 µg/m³). Only stations with more than 75 % of valid data have been included in the map.

Note: The graph is based on annual mean concentration values. For each country, the number of stations considered for 2024 (in brackets) are given. The boxplot represents the lowest (bottom of the whisker), highest (top of the whisker) and average (black dot) annual mean values (in µg/m³). The rectangles mark the 25th and 75th percentiles. At 25 % of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations are above the 75th percentile. The annual limit value set by EU legislation is marked by the upper continuous horizontal line. The WHO AQG level is marked by the lower dashed horizontal line. The graph should be read in relation to the above map, as a country's situation depends on the number of stations considered.

The highest value in the boxplot, Italy (217  $\mu$ g/m³), has not been included in the graph for representation purposes.

Figure 6 shows the maps of  $PM_{10}$  annual mean concentrations at station level for the last four years. In this way, any significant change in the spatial distribution of the values above the set thresholds in the legends can be observed. Note that only the last year's map (2024) is based on UTD data, while the previous three years are based on officially reported validated data (CDR).

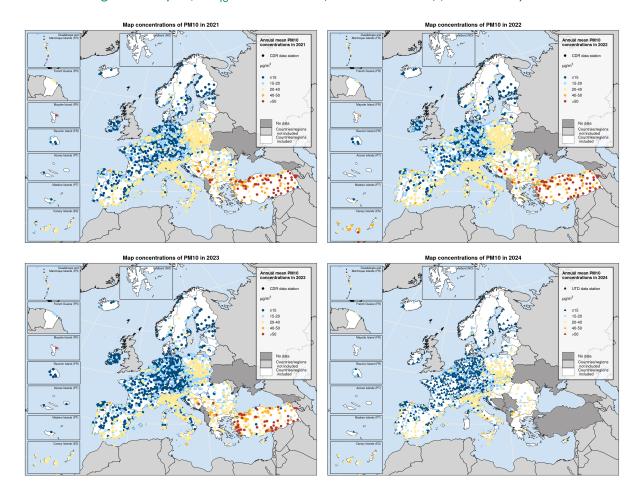

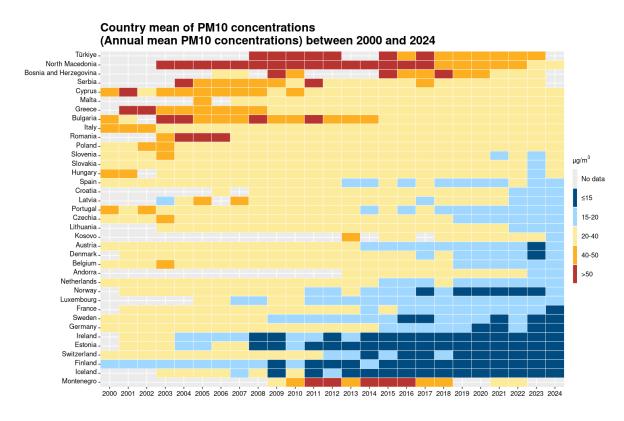

Figure 6: Maps of PM<sub>10</sub> concentrations (annual limit value) for the last 4 years

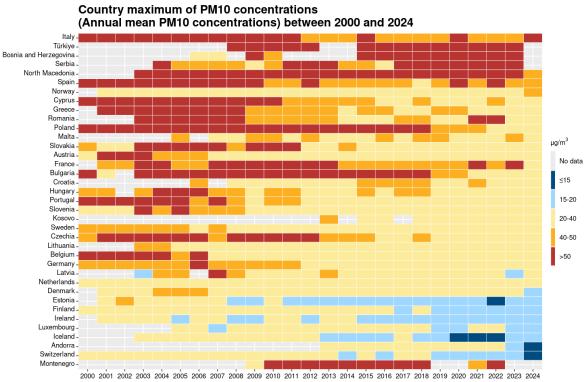

Maps for years before 2023 are different to the ones published in previous reports because the bands in the legend have been modified to accommodate the 2030 EU annual limit value (EU, 2024).

Heatmaps with the evolution from 2000 of the mean (top) and the maximum (bottom) annual mean  $PM_{10}$  concentrations at country level are shown in figure 7. In this way, the evolution along years of the average and maximum measured concentration levels can be seen for each country. Note that meteorological variability has a considerable impact on year-to-year changes

in ambient air concentrations of air pollutants (EEA, 2020), and the last year (2024) is based on UTD data, while the previous years are based on officially reported validated data.

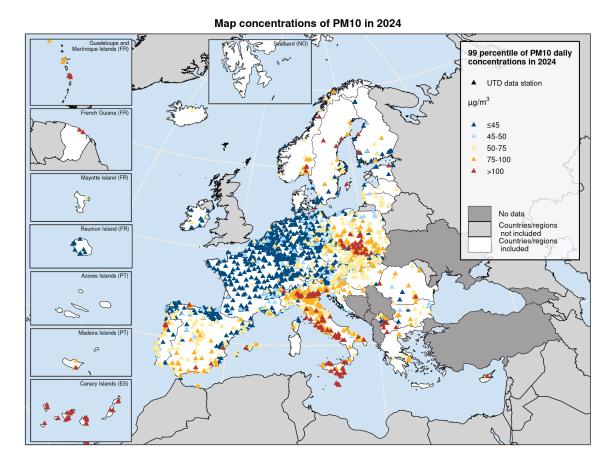

Figure 7: Evolution of mean (top) and maximum (bottom)  $PM_{10}$  annual mean concentrations (annual limit value) per country from 2000

Note: It is important to note that the figure is not based on a consistent set of stations. The number, location and classification of the stations included may vary from year to year.

Figure 8: UTD Map of  $PM_{10}$  concentrations in 2024 - daily WHO AQG level

Note: Observed concentrations of PM10 in 2024. The map shows the 99 percentile of the PM10 daily mean concentrations, equivalent to 3–4 exceedance days per year, according to the definition of the daily WHO AQG level (45 µg/m³). The first colour category indicates stations with concentrations below this AQG level. Only stations with more than 75 % of valid data have been included in the map.

Figure 9 shows the maps of the 99 percentile of  $PM_{10}$  daily mean concentrations (equivalent to the WHO AQG level for  $PM_{10}$  daily mean level) for the last four years. In this way, any significant change in the spatial distribution of the values above the set thresholds in the legends can be observed. Note that only the last year's map (2024) is based on UTD data, while the previous three years are based on officially reported validated data (CDR).

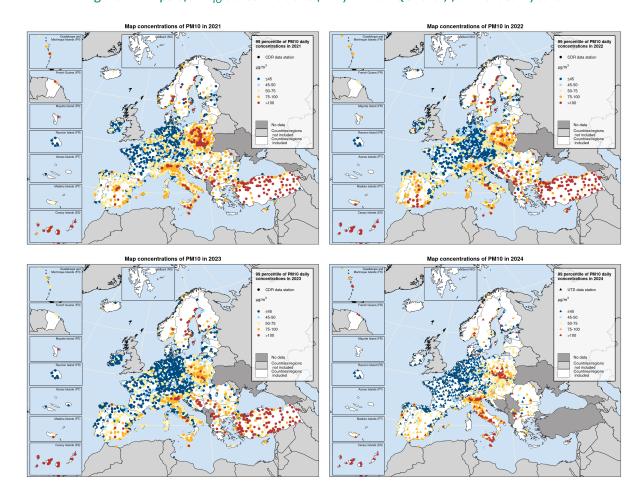

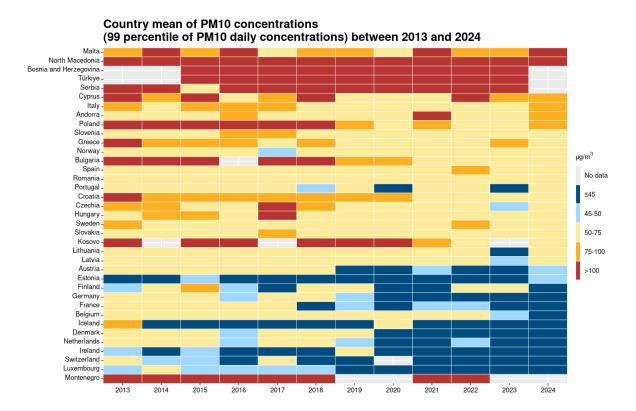

Figure 9: Maps of PM<sub>10</sub> concentrations (daily WHO AQG level) for the last 4 years

Heatmaps with the evolution from 2013 of the mean (top) and the maximum (bottom) 99 percentile of  $PM_{10}$  daily mean concentrations at country level are shown in figure 10. In this way, the evolution along years of the average and maximum measured concentration levels can be seen for each country. Note that meteorological variability has a considerable impact on year-to-year changes in ambient air concentrations of air pollutants (EEA, 2020), and the last year (2024) is based on UTD data, while the previous years are based on officially reported validated data.

Figure 10: Evolution of mean (top) and maximum (bottom) 99 percentile of  $PM_{10}$  daily mean concentrations (daily WHO AQG level) per country from 2013

### Country maximum of PM10 concentrations (99 percentile of PM10 daily concentrations) between 2013 and 2024 Türkiye Spain Italy Norway Bosnia and Herzegovina Serbia North Macedonia Poland Portugal France $\mu g/m^3$ Czechia Estonia No data Romania ≤45 Cyprus -Slovenia Croatia Bulgaria Greece Slovakia Austria 75-100 Hungary -Kosovo Andorra >100 Germany Iceland Lithuania Ireland Belgium Netherlands Switzerland Denmark Luxembourg Montenegro -2014 2016 2017 2018 2019 2020

Note: It is important to note that the figure is not based on a consistent set of stations. The number, location and classification of the stations included may vary from year to year.

### 3.2 Status of PM<sub>2.5</sub> concentrations

Regarding  $PM_{2.5}$ , data with sufficient valid measurements were received from 1605 stations for the calculation of annual mean concentrations and from 1597 stations in relation to the short-term WHO AQG level. These stations were located in all the reporting countries shown in Figure 1.

The PM<sub>2.5</sub> concentrations were higher than the EU annual limit value ( $25 \,\mu g/m^3$ ) in two countries in EU-27 and one other reporting countries (Figure 11). These concentrations above the limit value were registered in 0.6 % of all the reporting stations and occurred primarily (100 % of cases) in urban (67 %) or suburban (33 %) areas.

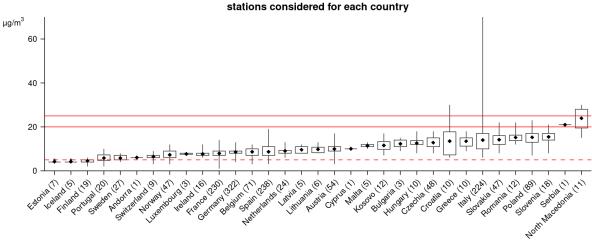

The WHO AQG level for  $PM_{2.5}$  annual mean (5  $\mu g/m^3$ ) was exceeded at 93 % of the stations, located in 31 of the 33 countries reporting  $PM_{2.5}$  data (Figure 11). Estonia and Iceland did not report any concentrations above the WHO AQG level for  $PM_{2.5}$ .

The WHO AQG level for  $PM_{2.5}$  daily mean (15  $\mu g/m^3$ ), expressed as percentile 99, it was exceeded at 96 % (1534 stations) of the stations in all the reporting countries (Figure 14).

Figure 11: UTD Map and boxplot of  $\mathrm{PM}_{2.5}$  concentrations in 2024 - annual limit value

# Map concentrations of PM2.5 in 2024 Annual mean PM2.5 concentrations in 2024 A UTD data station µg/m³ A s5 5-10 10-20 20-25 20-25 Access latards (PT) Marken Islands (PT) Marken Islands (PT) Marken Islands (PT)

Note: Observed concentrations of PM2.5 in 2024. The possibility of subtracting contributions to the measured concentrations from natural sources has not been considered. The last two colour categories indicate stations reporting concentrations above the EU indicative annual limit value (20 µg/m³) or the EU annual limit value (25 µg/m³). The first colour category indicates stations reporting values below the WHO AQG level for PM2.5 (5 µg/m³). Only stations with more than 75 % of valid data have been included in the map.

PM2.5 concentrations in relation to the annual limit value in 2024 and number of

Note: The graph is based on annual mean concentration values. For each country, the number of stations considered for 2024 (in brackets) are given. The boxplot represents the lowest (bottom of the whisker), highest (top of the whisker) and average (black dot) annual mean values (in µg/m³). The rectangles mark the 25th and 75th percentiles. At 25 % of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations are above the 75th percentile. The annual limit value and the indicative annual limit value set by EU legislation are marked by the upper continuous horizontal lines at 25 and 20, respectively. The WHO AQG level is marked by the lower dashed horizontal line. The graph should be read in relation to the above map, as a country's situation depends on the number of stations considered.

Figure 12 shows the maps of measured  $PM_{2.5}$  annual mean concentrations for the last four years. In this way, any significant change in the spatial distribution of the values above the set thresholds in the legends can be observed. Note that only the last year's map (2024) is based on UTD data, while the previous three years are based on officially reported validated data (CDR).

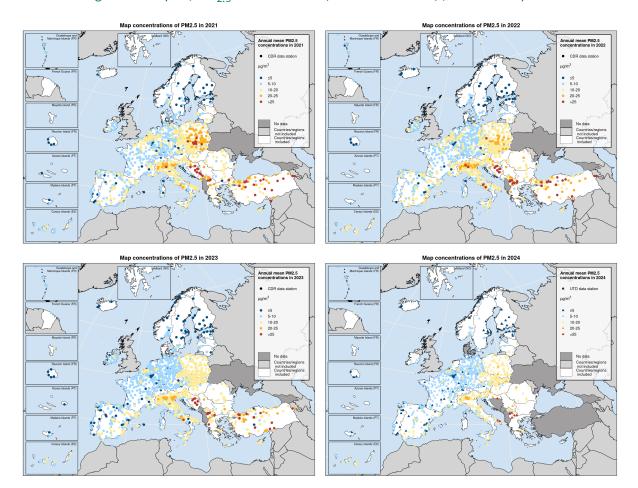

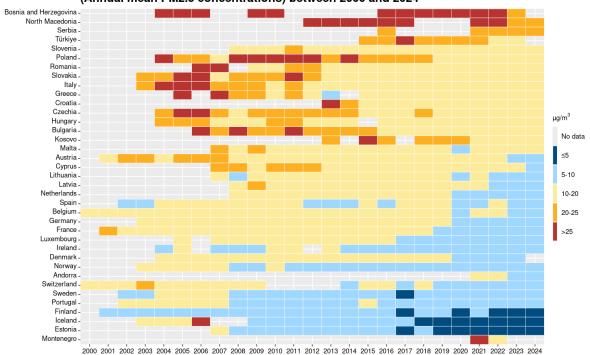

Figure 12: Maps of  $PM_{2.5}$  concentrations (annual limit value) for the last 4 years

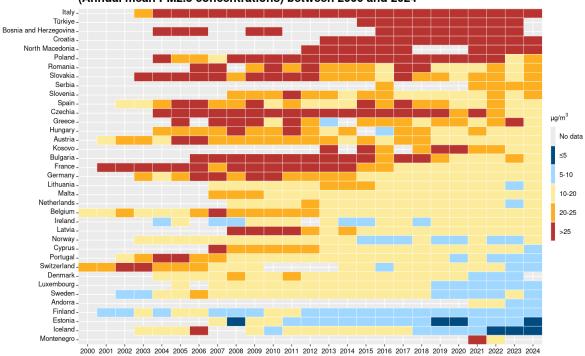

Heatmaps with the evolution from 2000 of the mean (top) and the maximum (bottom)  $PM_{2.5}$  annual mean concentrations at country level are shown in figure 13. In this way, the evolution along years of the average and maximum measured concentration levels can be seen for each country. Note that meteorological variability has a considerable impact on year-to-year changes in ambient air concentrations of air pollutants (EEA, 2020), and the last year (2024) is based on UTD data, while the previous years are based on officially reported validated data.

# Country maximum of PM2.5 concentrations (Annual mean PM2.5 concentrations) between 2000 and 2024

Note: It is important to note that the figure is not based on a consistent set of stations. The number, location and classification of the stations included may vary from year to year.

Figure 14: UTD Map of  $\mathrm{PM}_{2.5}$  concentrations in 2024 - daily WHO AQG level

Note: Observed concentrations of PM2.5 in 2024. The map shows the 99 percentile of the PM2.5 daily mean concentrations,

equivalent to 3–4 exceedance days per year, according to the definition of the daily WHO AQG level (15  $\mu$ g/m³). The first colour category indicates stations with concentrations below this AQG level. Only stations with more than 75 % of valid data have been included in the map.

Figure 15 shows the maps of the 99 percentile of  $PM_{2.5}$  daily mean concentrations (equivalent to the WHO AQG level for  $PM_{2.5}$  daily mean level) for the last four years. In this way, any significant change in the spatial distribution of the values above the set thresholds in the legends can be observed. Note that only the last year's map (2024) is based on UTD data, while the previous three years are based on officially reported validated data (CDR).

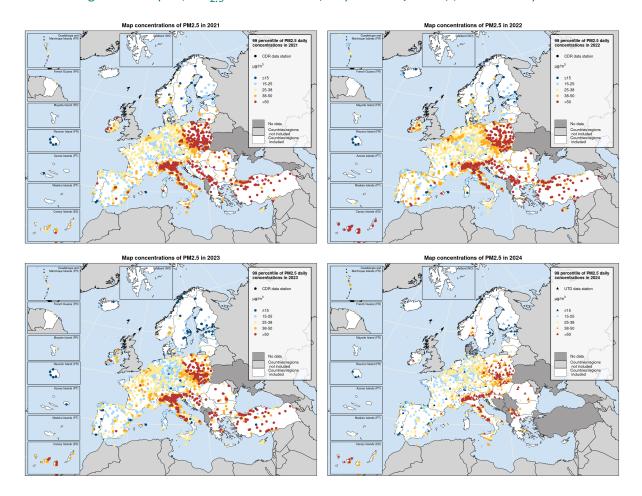

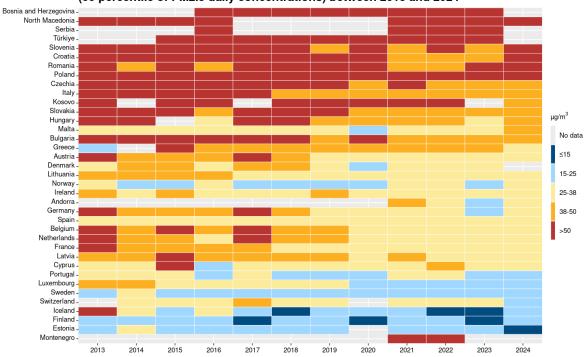

Figure 15: Maps of PM<sub>2.5</sub> concentrations (daily WHO AQG level) for the last 4 years

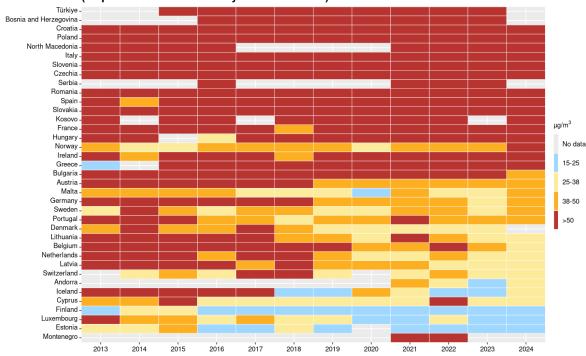

Heatmaps with the evolution from 2013 of the mean (top) and the maximum (bottom) 99 percentile of  $PM_{2.5}$  daily mean concentrations at country level are shown in figure 16. In this way, the evolution along years of the average and maximum measured concentration levels can be seen for each country. Note that meteorological variability has a considerable impact on year-to-year changes in ambient air concentrations of air pollutants (EEA, 2020), and the last year (2024) is based on UTD data, while the previous years are based on officially reported validated data.

Figure 16: Evolution of mean (top) and maximum (bottom) 99 percentile of  $PM_{2.5}$  daily mean concentrations (daily WHO AQG level) per country from 2013

# Country maximum of PM2.5 concentrations (99 percentile of PM2.5 daily concentrations) between 2013 and 2024

Note: It is important to note that the figure is not based on a consistent set of stations. The number, location and classification of the stations included may vary from year to year.

### 4 Status of ozone ambient air concentrations

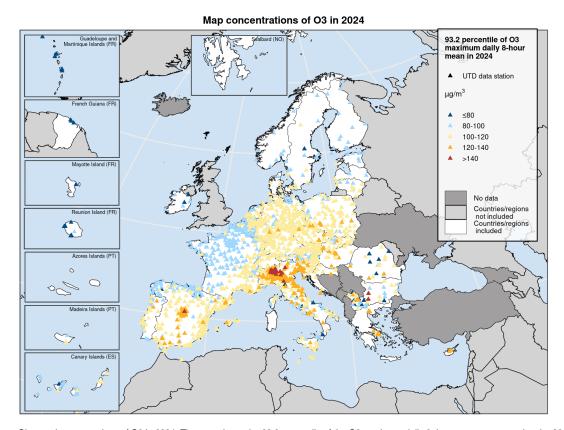

Data for  $O_3$  were reported from 1938 stations for the calculation of EU standards, from 1938 stations in relation to the short-term WHO AQG level, and from 1876 stations for the long-term WHO AQG level. These stations were located in all the reporting countries shown in Figure 1.

16 countries in EU-27 and 3 other reporting countries registered concentrations above the  $O_3$  target value threshold (120  $\mu g/m^3$ ) more than 25 times this year (Figure 17). In total, 13 % of all stations reporting  $O_3$  showed concentrations above the target value threshold for the protection of human health. In addition, only 22 % (420) of all stations fulfilled the long-term objective (120  $\mu g/m^3$ ). 87 % of the stations with values above the long-term objective were background stations.

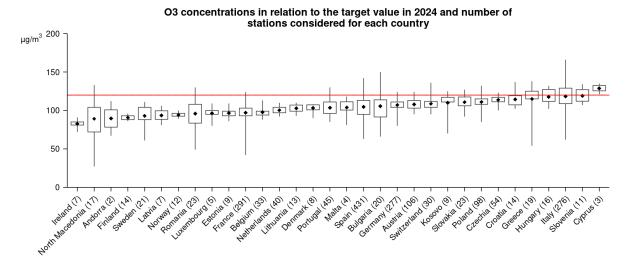

8% (146) of all stations and only 19 of the 502 reported rural background stations had values below the short-term WHO AQG value for  $O_3$  (100  $\mu g/m^3$ ) (Figure 20), set for the protection of human health. The long-term, peak season(4), WHO AQG level (60  $\mu g/m^3$ ) was exceeded in 98 % (1837) of all stations located in 27 countries in EU-27 and 6 other reporting countries. Only 1 of the 484 reported rural background stations had values below this AQG level (Figure 23).

 $<sup>^4</sup>$ The peak season is calculated for each station as the average of daily maximum 8-hour mean O3 concentration in the six consecutive months with the highest six-month running-average  $O_3$  concentration. That means that, for each station, twelve 6-months running averages of the daily 8-h max are calculated (1 August YY-1 to 31 January YY, ..., 1 January YY to 30 June YY, ..., 1 July YY to 31 December YY) and the maximum of those 12 values is selected as the peak season concentration. Please check also Data Dictionary - Vocabulary (https://dd.eionet.europa.eu/vocabularyconcept/aq/aggregationprocess/P1Y-maxP6M-P8H-dmax/view?vocabularyFo lder.workingCopy=false&facet=HTML+Representation).

Figure 17: UTD Map and boxplot of O<sub>3</sub> concentrations in 2024

Note: Observed concentrations of O3 in 2024. The map shows the 93.2 percentile of the O3 maximum daily 8-hour mean, representing the 26th highest value in a complete series. It is related to the O3 target value. At sites marked with the last two colour categories, the 26th highest daily O3 concentrations were above the 120 μg/m³ threshold, implying values above the target value threshold. Please note that the legal definition of the target value considers not only 1 year but the average over 3 years. Only stations with more than 75 % of valid data have been included in the map.

Note: The graph is based, for each country, on the 93.2 percentile of the maximum daily 8–hour mean concentration values, corresponding to the 26th highest daily maximum of the running 8–hour mean in a complete time series. For each country, the number of stations considered for 2024 (in brackets) are given. The boxplot represents the lowest (bottom of the whisker), highest (top of the whisker) and average (black dot) values (in µg/m³). The rectangles mark the 25th and 75th percentiles. At 25 % of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations are above the 75th percentile. The target value threshold set by the EU legislation is marked by the horizontal line. Please note that the legal definition of the target value considers not only 1 year but the average over 3 years. The graph should be read in relation to the above map, as a country's situation depends on the number of stations considered.

The highest value in the boxplot, Italy (166  $\mu$ g/m³), has not been included in the graph for representation purposes.

Figure 18 shows the maps of the observed 93.2 percentile of the  $O_3$  maximum daily 8-hour mean concentrations ( $O_3$  target value) for the last four years. In this way, any significant change in the spatial distribution of the values above the set thresholds in the legends can be observed. Note that only the last year's map (2024) is based on UTD data, while the previous three years are based on officially reported validated data (CDR).

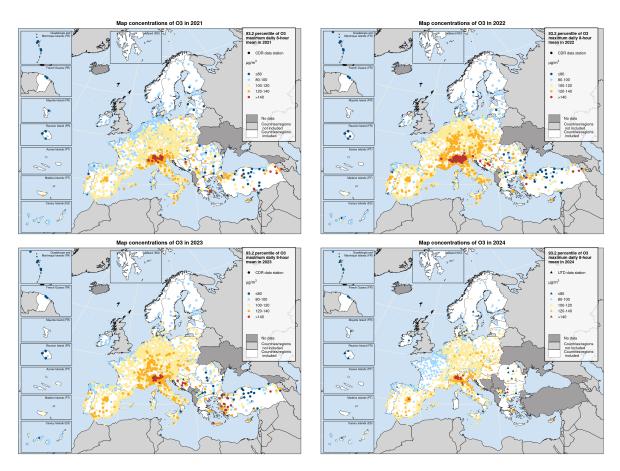

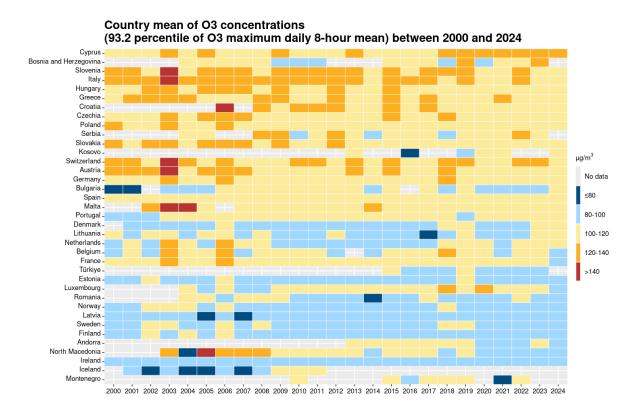

Figure 18: Maps of O<sub>3</sub> concentrations (related to the target value) for the last 4 years

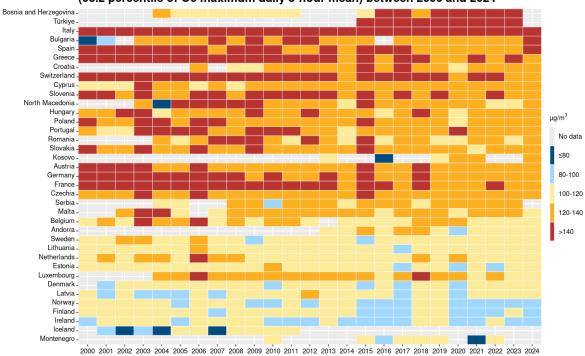

Note: Please be aware that the TV considers the average over 3 years and the maps only show the situation for one specific year.

Heatmaps with the evolution from 2000 of the mean (top) and the maximum (bottom)  $O_3$  concentrations (93.2 percentile of the maximum daily 8-hour mean concentration, target value) at country level are shown in figure 19. In this way, the evolution along years of the average and maximum measured concentration levels can be seen for each country. Note that meteorological variability has a considerable impact on year-to-year changes in ambient air concentrations of air pollutants (EEA, 2020), especially for  $O_3$  as higher ambient air temperature leads to enhanced photochemical reactions and  $O_3$  formation. The last year (2024) is based on UTD data, while the previous years are based on officially reported validated data.

Figure 19: Evolution of mean (top) and maximum (bottom)  $O_3$  concentrations (93.2 percentile of the maximum daily 8-hour mean concentration, related to the target value) per country from 2000

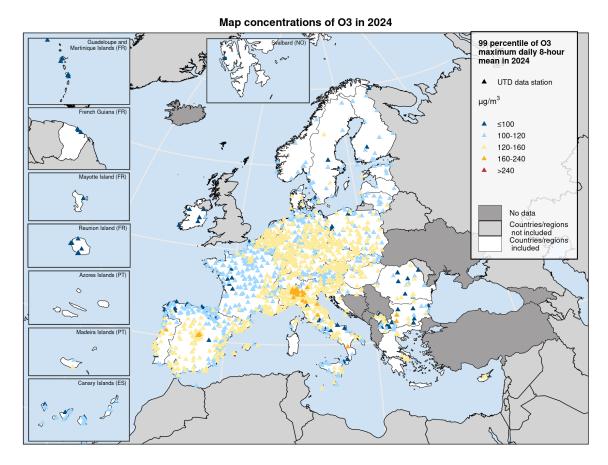

# Country maximum of O3 concentrations (93.2 percentile of O3 maximum daily 8-hour mean) between 2000 and 2024

Note: It is important to note that the figure is not based on a consistent set of stations. The number, location and classification of the stations included may vary from year to year.

Figure 20: UTD Map of  $O_3$  concentrations in 2024 - short-term WHO AQG level

Note: Observed concentrations of O3 in 2024. The map shows the 99 percentile of the O3 maximum daily 8-hour mean concentrations, equivalent to 3-4 exceedance days per year, according to the definition of the short-term WHO AQG level (100 µg/m³).

The first colour category indicates stations with concentrations below this AQG level.

Only stations with more than 75 % of valid data have been included in the map.

Figure 21 shows the maps of the 99 percentile of the  $O_3$  maximum daily 8-hour mean concentrations (equivalent to the short-term WHO AQG level) for the last four years. In this way, any significant change in the spatial distribution of the values above the set thresholds in the legends can be observed. Note that only the last year's map (2024) is based on UTD data, while the previous three years are based on officially reported validated data (CDR).

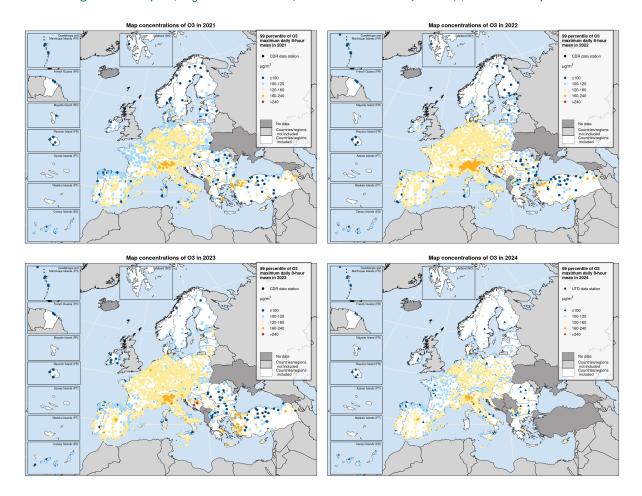

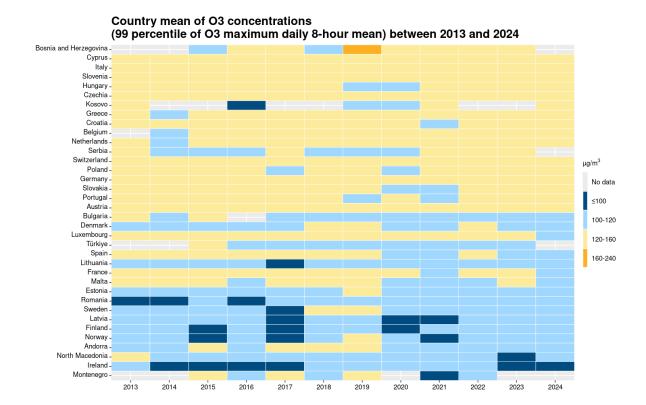

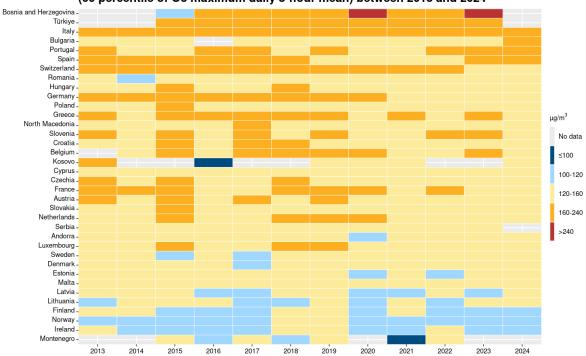

Figure 21: Maps of O<sub>3</sub> concentrations (short-term WHO AQG level) for the last 4 years

Heatmaps with the evolution from 2013 of the mean (top) and the maximum (bottom) 99 percentile of the  $O_3$  maximum daily 8-hour mean concentrations at country level are shown in figure 22. In this way, the evolution along years of the average and maximum measured concentration levels can be seen for each country. Note that meteorological variability has a considerable impact on year-to-year changes in ambient air concentrations of air pollutants (EEA, 2020), and the last year (2024) is based on UTD data, while the previous years are based on officially reported validated data.

Note: It is important to note that the figure is not based on a consistent set of stations. The number, location and classification of the stations included may vary from year to year.

### 5 Status of nitrogen dioxide ambient air concentrations

The reporting countries shown in Figure 1 submitted  $NO_2$  data from 2843 stations for the annual limit value, 2742 stations for the hourly limit value, and 2723 stations for the daily WHO AQG level.

6 of the countries in EU-27 and 1 other reporting countries (Figure 26) recorded concentrations above the annual limit value (40  $\mu g/m^3$ ). This happened in 1% of all the stations measuring NO<sub>2</sub>. On the contrary, 65% of stations, located in 27 of the countries in EU-27 and 7 other reporting countries reported concentrations above the WHO AQG level of 10  $\mu g/m^3$ . Figure 26 shows the measured annual mean NO<sub>2</sub> concentrations.

96 % of all values above the annual limit value were observed at traffic stations. Furthermore, 100 % of the stations with concentrations above the annual limit value were located in urban or suburban areas.

Concentrations above the hourly limit value (200  $\mu$ g/m³) were observed in 0.04 % (1 urban traffic station). It was observed in one countries. (Italy (one)).

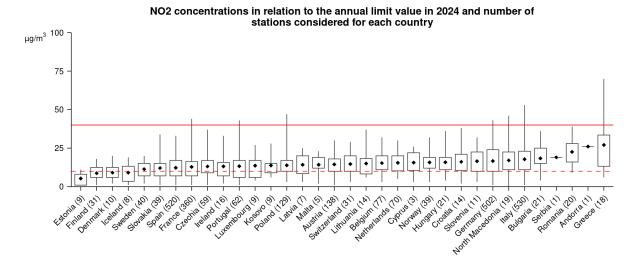

Finally, concentrations above the daily  $NO_2$  WHO AQG level (25  $\mu$ g/m<sup>3</sup>) were registered in 72 % (1948 stations) of all the reporting stations in 27 of the countries in EU-27 and 6 other reporting countries (Figure 29).

Luxembourg -Denmark -Estonia -

### 6 Status of sulphur dioxide ambient air concentrations

The reporting countries shown in Figure 1 reported measurements of  $SO_2$  from 1159 stations for the hourly limit value and 1144 stations for the daily limit value.

7 stations ( $^5$ ) registered concentrations above the hourly limit value ( $350 \mu g/m^3$ ); and 5 stations ( $^6$ ) registered concentrations above the daily limit of 125  $\mu g/m^3$  for SO<sub>2</sub> (Figure 32).

On the contrary, 32 (3 %) of all the stations reporting  $SO_2$  levels, located in 12 reporting countries (7), measured  $SO_2$  concentrations above the WHO AQG level of 40  $\mu$ g/m<sup>3</sup> for daily mean concentrations (8).

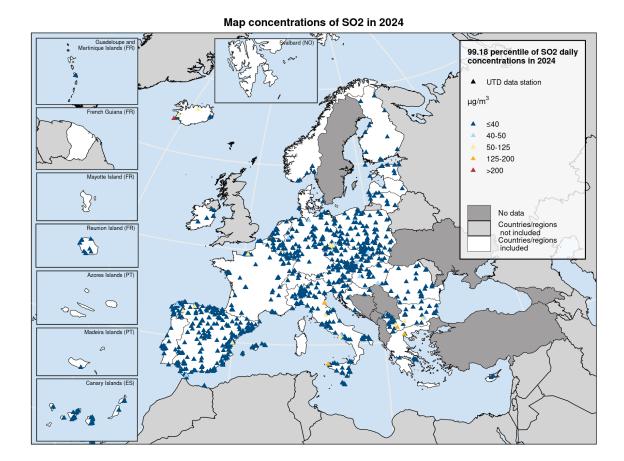

<sup>&</sup>lt;sup>5</sup>Italy (six) and Iceland (one)

<sup>&</sup>lt;sup>6</sup>Italy (two), Greece (one), Iceland (one) and North Macedonia (one).

<sup>&</sup>lt;sup>7</sup>All reporting countries except Andorra, Austria, Belgium, Croatia, Cyprus, Denmark, Estonia, Finland, Ireland, Kosovo, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Portugal, Romania, Slovenia and Switzerland.

<sup>&</sup>lt;sup>8</sup>Although the WHO AQG level for daily means refers to the percentile 99 (3-4 exceedance days), here we have used the percentile 99.18 (3 exceedance days), so the daily WHO AQG level can be directly compared with the EU daily LV.

Figure 32: Map of  $SO_2$  daily concentrations in 2024

Note: Observed concentrations of SO2 in 2024. The map shows the percentile 99.18 of SO2 daily means, indicating 3 exceedance days. It relates to the EU daily limit value (125 μg/m³) and to the WHO daily AQG level (40 μg/m³).

Only stations with more than 75 % of valid data have been included in the map.

Figure 33 shows the maps of the observed  $SO_2$  daily mean concentrations for the last four years. In this way, any significant change in the spatial distribution of the values above the set thresholds in the legends can be observed. Note that only the last year's map (2024) is based on UTD data, while the previous three years are based on officially reported validated data (CDR).

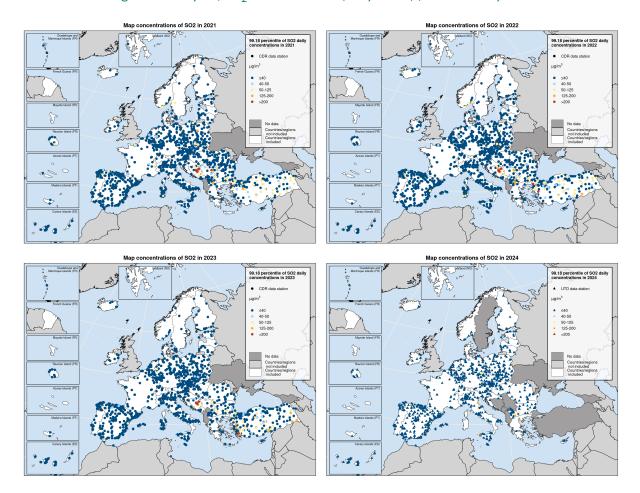

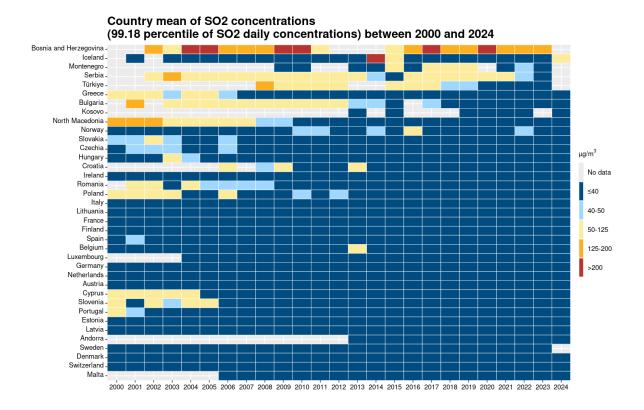

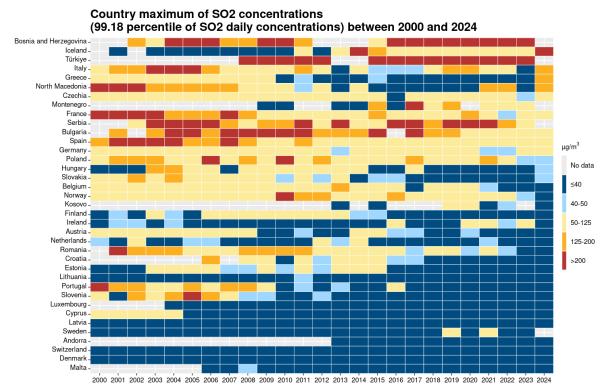

Figure 33: Maps of SO<sub>2</sub> concentrations (daily mean) for the last 4 years

Heatmaps with the evolution from 2000 of the mean (top) and the maximum (bottom)  $SO_2$  daily mean concentrations at country level are shown in figure 34. In this way, the evolution along years of the average and maximum measured concentration levels can be seen for each country. Note that meteorological variability has a considerable impact on year-to-year changes in ambient air concentrations of air pollutants (EEA, 2020), and the last year (2024) is based on UTD data, while the previous years are based on officially reported validated data.

Figure 34: Evolution of mean (top) and maximum (bottom)  $SO_2$  99.18 percentile of daily mean concentrations (EU LV (125  $\mu$ g/m³)) and WHO AQG level (40  $\mu$ g/m³)) per country from 2000

Note: It is important to note that the figure is not based on a consistent set of stations. The number, location and classification of the stations included may vary from year to year.

## 7 Abbreviations, units and symbols

μg/m<sup>3</sup>: microgram(s) per cubic metre

AAQD: Ambient Air Quality Directives

AQG: Air quality guideline

CDR: Central data repository

**EEA: European Environment Agency** 

ETC HE: European Topic Centre on Human health and the Environment

EU: European Union

LV: limit value

NO<sub>2</sub>: Nitrogen dioxide

O<sub>3</sub>: Ozone

PM: Particulate matter

 $PM_{2.5}\text{:}$  Particulate matter with a diameter of 2.5  $\mu m$  or less

 $PM_{10}\colon Particulate$  matter with a diameter of 10  $\mu m$  or less

RL: Reference level

SO<sub>2</sub>: Sulphur dioxide

TV: target value

UTD: up-to-date

WHO: World Health Organization

### 8 Annex 1

Data included in this report was received by 19 February 2025 from the reporting countries. By that date the number of stations by country aggregation reporting each pollutant is summarized in Table 3. Data from stations that do not fulfil the criteria from Box 1.1 are excluded from this report.

Table 3: Reporting status of 2024 air quality data by 19 February 2025

Countries	PM10	PM2.5	О3	NO2	SO2

# 9 Annex 2 - Air quality status in relation to the new standards in the revised AAQD (EU) 2024/2081

On 20 November 2024, the revised Directive (EU) 2024/2881 (EU, 2024) on ambient air quality and cleaner air for Europe was published and it entered into force on 10 December 2024. This Directive amends and recasts Directives 2004/107/EC (EU, 2004) and 2008/50/EC (EU, 2008). Among other changes, it has introduced new air quality (AQ) standards (or revised the ones in the 2004 and 2008 Directives) setting the attainment date at 1 January 2030. The revised and new standards for the protection of human health are summarised in table 6).

Table 6: Air quality standards for the protection of health, as given in the revised EU Ambient Air Quality Directive (EU) 2024/2881

Pollutant	Averaging period	Legal nature and concentration	Comments
PM <sub>10</sub>	1 day	Limit value: 45 μg/m <sup>3</sup>	Not to be exceeded more than 18 times per
			calendar year
		Alert threshold: 90 μg/m <sup>3</sup>	To be measured as a daily average over 3
			consecutive days or less at locations
			representative of air quality over at least 100
			km <sup>2</sup> or an entire zone, whichever is the smaller
		Information threshold: 90 μg/m <sup>3</sup>	To be measured over 1 day at locations
			representative of air quality over at least 100
			km <sup>2</sup> or an entire zone, whichever is the smaller
	Calendar year	Limit value: 20 μg/m <sup>3</sup>	
PM <sub>2.5</sub>	1 day	Limit value: 25 μg/m <sup>3</sup>	Not to be exceeded more than 18 times per
			calendar year
		Alert threshold: 50 μg/m <sup>3</sup>	To be measured as a daily average over 3
			consecutive days or less at locations
			representative of air quality over at least 100
			km <sup>2</sup> or an entire zone, whichever is the smaller
		Information threshold: 50 μg/m <sup>3</sup>	To be measured over 1 day at locations
			representative of air quality over at least 100
			${\rm km}^2$ or an entire zone, whichever is the smaller
	Calendar year	Limit value: 10 μg/m <sup>3</sup>	
		Average exposure reduction obligation,	The percentage reduction depends on the initia
		10-25% reduction of the Average Exposure	AEI in 2020 ( <sup>a</sup> )
		Indicator (AEI) in 2020	
		Average exposure concentration objective,	
		AIE: 5 μg/m <sup>3</sup>	
O <sub>3</sub>	1 hour	Alert threshold: 240 μg/m <sup>3</sup>	
		Information threshold: 180 μg/m <sup>3</sup>	
	Maximum daily	Target value: 120 μg/m <sup>3</sup>	Not to be exceeded on more than 18 days per
	8-hour mean ( <sup>b</sup> )		calendar year averaged over 3 years ( <sup>c</sup> )

Table 6: Air quality standards for the protection of health, as given in the revised EU Ambient Air Quality Directive (EU) 2024/2881 (continued)

Pollutant	Averaging period	Legal nature and concentration	Comments
	Maximum daily 8-hour mean within a calendar year	Long term objective: 100 μg/m <sup>3</sup>	Not to be exceeded more than 3 days per calendar year (99th percentile)
NO <sub>2</sub>	1 hour	Limit value: 200 μg/m <sup>3</sup>	Not to be exceeded more than 3 times per calendar year
		Alert threshold: 200 μg/m <sup>3</sup>	To be measured as a daily average over 3 consecutive days or less at locations representative of air quality over at least 100 km <sup>2</sup> or an entire zone, whichever is the smaller
		Information threshold: 150 μg/m <sup>3</sup>	To be measured over 1 day at locations representative of air quality over at least 100 km <sup>2</sup> or an entire zone, whichever is the smaller
	1 day	Limit value: 50 μg/m <sup>3</sup>	Not to be exceeded more than 18 times per calendar year
	Calendar year	Limit value: 20 μg/m <sup>3</sup>	
		Average exposure reduction obligation, 15-25% reduction of the Average Exposure Indicator (AEI) in 2020	The percentage reduction depends on the initia  AEI in 2020 ( <sup>a</sup> )
		Average exposure concentration objective, AIE: 10 $\mu g/m^3$	
BaP	Calendar year	Limit value: 1,0 ng/m <sup>3</sup>	
SO <sub>2</sub>	1 hour	Limit value: 350 μg/m <sup>3</sup>	Not to be exceeded more than 3 times per calendar year
		Alert threshold: 350 μg/m <sup>3</sup>	To be measured as a daily average over 3 consecutive days or less at locations representative of air quality over at least 100 km <sup>2</sup> or an entire zone, whichever is the smaller
		Information threshold: 275 μg/m <sup>3</sup>	To be measured over 1 day at locations representative of air quality over at least 100 km <sup>2</sup> or an entire zone, whichever is the smaller
	1 day	Limit value: 50 μg/m <sup>3</sup>	Not to be exceeded more than 18 times per calendar year
СО	Maximum daily 8-hour mean ( <sup>b</sup> )	Limit value: 10 mg/m <sup>3</sup>	
	1 day	Limit value: 4 mg/m <sup>3</sup>	Not to be exceeded more than 18 times per calendar year

Table 6: Air quality standards for the protection of health, as given in the revised EU Ambient Air Quality Directive (EU) 2024/2881 (continued)

Pollutant	Averaging period	Legal nature and concentration	Comments	

#### Notes:

- <sup>a</sup> AEI: based upon measurements at all sampling points in urban background locations in average exposure territorial units throughout the territory of a Member State, assessed as a 3-year running annual mean.
- b The maximum daily 8-hour mean concentration shall be selected by examining 8-hour running averages, calculated from hourly data and updated each hour. Each 8-hour average so calculated shall be assigned to the day on which it ends, i.e. the first calculation period for any 1 day shall be the period from 17:00 on the previous day to 1:00 on that day; the last calculation period for any 1 day shall be the period from 16:00 to 24:00 on that day.
- c If the 3-year average cannot be determined on the basis of a full and consecutive set of annual data, the minimum annual data required for checking compliance with the ozone target value shall be valid data for 1 year.

This annex analyses the situation in year 2024 with respect to some of the new and/or revised AQ standards (9) using the same air quality data as those in the main section. It provides:

- a European overview of the 2024 monitoring stations reported, and of their concentrations in relation to some EU legal standards defined in the Directive (EU) 2024/2881 (EU, 2024);
- a map with the 2024 concentrations at station level for each pollutant relevant to each AQ standard;
- a boxplot graph summarizing for each country the range of concentrations (highlighting the lowest, highest, average and the 25 and 75 percentiles) for PM<sub>10</sub>, PM<sub>2.5</sub>, NO<sub>2</sub> and O<sub>3</sub>.

It should be noted that this assessment is only intended to shed light on the current situation in relation to the 2030 AQ standards, and the 'distance to target', i.e. the scale of the challenge to meet those standards by 2030. This analysis may also help to identify air quality zones where air quality roadmaps may need to be established. Roadmaps are air quality plans that must be implemented where, from 2026 to 2029, levels of pollutants are foreseen to be above the 2030 limit and target values.

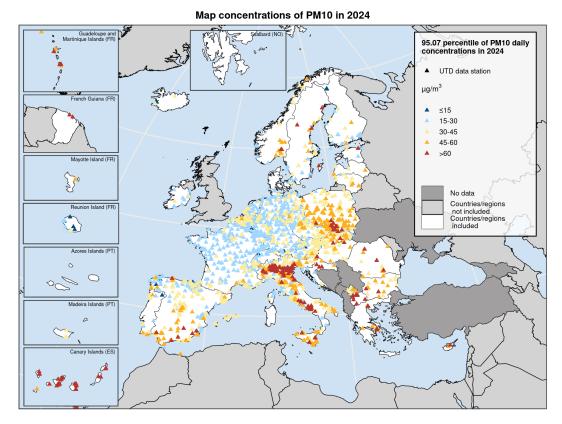

<sup>&</sup>lt;sup>9</sup>Only for the limit values and O3 target value and long-term objective

## 9.1 Status of $PM_{10}$ concentrations

Twenty-two countries in EU-27, and three other reporting countries reported  $PM_{10}$  concentrations above the 2030 EU daily limit value of 45  $\mu g/m^3$ , more than 18 days over the calendar year (Figure 35). This applied to 23 % (565) of reporting stations.

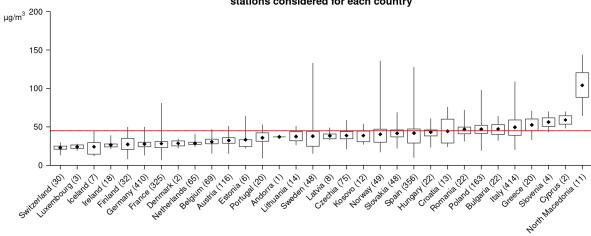

Concentrations above the 2030  $PM_{10}$  annual limit value (20  $\mu g/m^3$ ) were monitored in 31 % (785 stations) of all the reporting stations, located in 22 countries in EU-27, and 3 other reporting countries (Figure 36).

Figure 35: UTD Map and boxplot of PM<sub>10</sub> concentrations in 2024 - 2030 daily limit value

Note: The figure shows observed concentrations of PM10 in 2024. The possibility of subtracting contributions to the measured concentrations from natural sources and winter road sanding/salting has not been considered. The map shows the 95.07 percentile of the PM10 daily mean concentrations, representing the 19th highest value in a complete series. It is related to the 2030 PM10 daily limit value, allowing 18 exceedances of the 45 µg/m³ threshold over 1 year. The last two colour categories indicate stations with concentrations above this daily limit value.

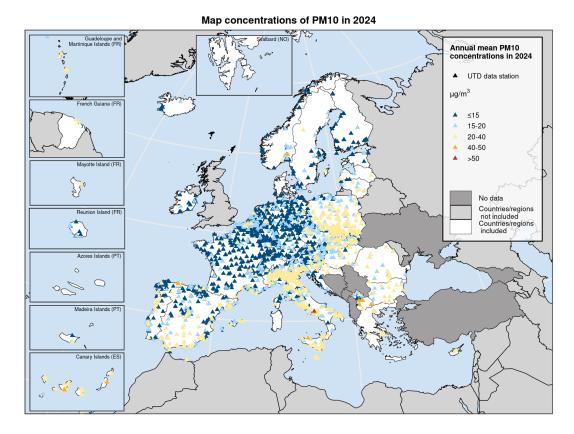

Only stations with more than 75 % of valid data have been included in the map.

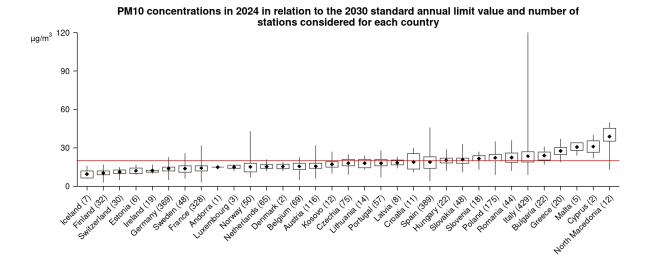

PM10 concentrations in 2024 in relation to the 2030 standard daily limit value and number of stations considered for each country

Note: The graph is based on the 95.07 percentile of daily mean concentration values corresponding to the 19th highest daily mean in complete time series. For each country, the number of stations considered for 2024 (in brackets) are given. The boxplot represents the lowest (bottom of the whisker), highest (top of the whisker) and average (black dot) 95.07 percentile values (in µg/m³). The rectangles mark the 25th and 75th percentiles. At 25% of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations are above the 75th percentile. The daily limit value set by EU legislation for 2030 is marked by the horizontal line. The graph should be read in relation to the above map, as a country's situation depends on the number of stations considered.

Figure 36: UTD Map and Boxplot of PM<sub>10</sub> concentrations in 2024 - 2030 annual limit value

Note: Observed concentrations of PM10 in 2024. The possibility of subtracting contributions to the measured concentrations from natural sources and winter road sanding/salting has not been considered. The last three colour categories indicate stations reporting concentrations above the 2030 EU annual limit value (20 µg/m³). Only stations with more than 75 % of valid data, have been included in the map.

Note: The graph is based on annual mean concentration values. For each country, the number of stations considered for 2024 (in brackets) are given.

The boxplot represents the lowest (bottom of the whisker), highest (top of the whisker) and average (black dot) annual mean values (in µg/m³).

The rectangles mark the 25th and 75th percentiles. At 25 % of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations are above the 75th percentile. The annual limit value set by EU legislation for 2030 is marked by the continuous horizontal line. The graph

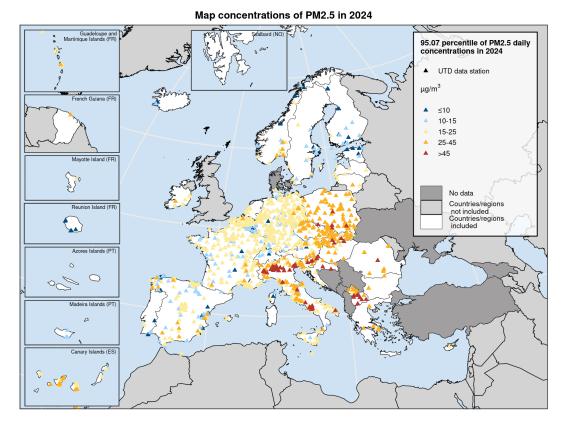

should be read in relation to the above map, as a country's situation depends on the number of stations considered.

### 9.2 Status of PM<sub>2.5</sub> concentrations

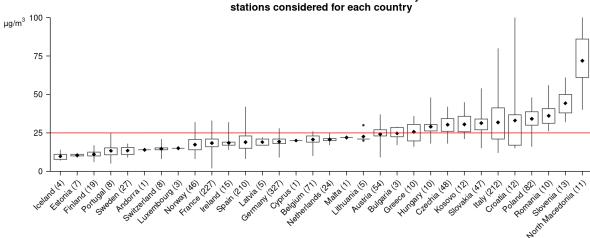

Seventeen countries in EU-27, and three other reporting countries reported  $PM_{2.5}$  concentrations above the 2030 EU daily limit value of 25  $\mu$ g/m<sup>3</sup>, more than 18 days over the calendar year (Figure 37). This was the case for 27 % (410) of reporting stations (Figure 37).

The PM<sub>2.5</sub> concentrations were higher than the 2030 EU annual limit value (10  $\mu$ g/m<sup>3</sup>) in twenty countries in EU-27 and four other reporting countries (Figure 38). These concentrations above the limit value were registered in 34 % (542 stations) of all the reporting stations.

Figure 37: UTD Map and boxplot of  $PM_{2.5}$  concentrations in 2024 - 2030 daily limit value

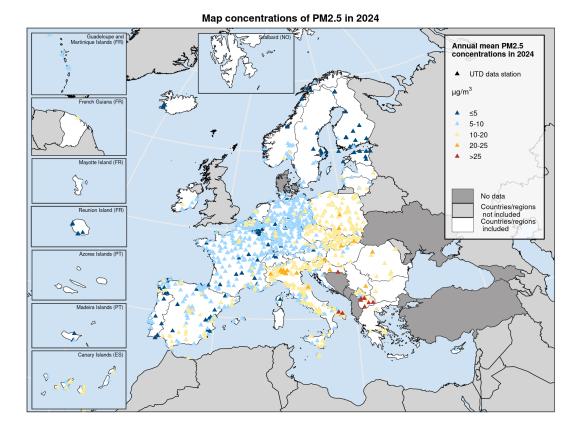

Note: The figure shows observed concentrations of PM2.5 in 2024. The possibility of subtracting contributions to the measured concentrations from natural sources has not been considered. The map shows the 95.07 percentile of the PM2.5 daily mean concentrations, representing the 19th highest value in a complete series. It is related to the 2030 PM2.5 daily limit value, allowing 18 exceedances of the 25 µg/m³ threshold over 1 year. The last two colour categories indicate stations with concentrations above this daily limit value. Only stations with more than 75 % of valid data have been included in the map.

PM2.5 concentrations in 2024 in relation to the 2030 standard daily limit value and number of

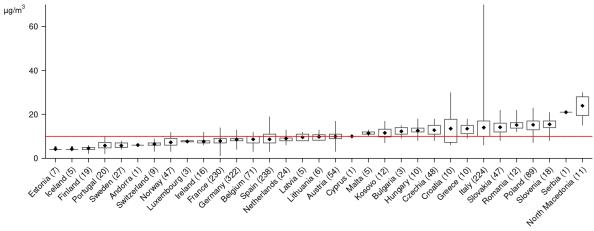

Note: The graph is based on the 95.07 percentile of daily mean concentration values corresponding to the 19th highest daily mean in complete time series. For each country, the number of stations considered for 2024 (in brackets) are given. The boxplot represents the lowest (bottom of the whisker), highest (top of the whisker) and average (black dot) 95.07 percentile values (in µg/m³). The rectangles mark the 25th and 75th percentiles. At 25% of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations are above the 75th percentile. The daily limit value set by EU legislation for 2030 is marked by the horizontal line. The graph should be read in relation to the above map, as a country's situation depends on the number of stations considered.

Figure 38: UTD Map and Boxplot of  $\mathrm{PM}_{2.5}$  concentrations in 2024 - 2030 annual limit value

Note: Observed concentrations of PM2.5 in 2024. The possibility of subtracting contributions to the measured concentrations from natural sources has not been considered. The last three colour categories indicate stations reporting concentrations above the 2030 EU annual limit value (10 µg/m³). Only stations with more than 75 % of valid data, have been included in the map.

Note: The graph is based on annual mean concentration values. For each country, the number of stations considered for 2024 (in brackets) are given.

The boxplot represents the lowest (bottom of the whisker), highest (top of the whisker) and average (black dot) annual mean values (in µg/m³).

The rectangles mark the 25th and 75th percentiles. At 25 % of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations are above the 75th percentile. The annual limit value set by EU legislation for 2030 is marked by the continuous horizontal line. The graph should be read in relation to the above map, as a country's situation depends on the number of stations considered.

### 9.3 Status of O<sub>3</sub> ambient air concentrations

16 countries in EU-27 and 3 other reporting countries reported concentrations above the 2030  $O_3$  target value threshold (120  $\mu$ g/m³) more than 18 times this year (Figure 39). In total, 18 % (340 stations) of all stations reporting  $O_3$  showed concentrations above the 2030 target value threshold for the protection of human health.

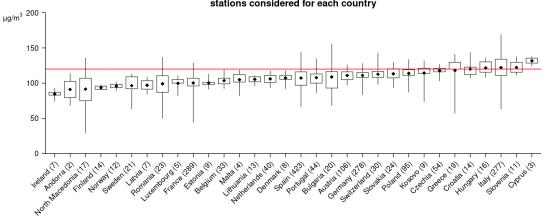

Since the 2030 long-term objective aligns with the short-term WHO AQG (100  $\mu g/m^3$  as percentile 99), please refer to the main text and Figure 20 for an overview of the current situation in relation to the 2030 long-term objective.

Figure 39: UTD Map and boxplot of  $O_3$  concentrations in 2024 - 2030 target value threshold.

Note: Observed concentrations of O3 in 2024. The map shows the 95.07 percentile of the O3 maximum daily 8–hour mean, representing the 19th highest value in a complete series. It is related to the 2030 O3 target value. At sites marked with the last two colour categories, the 19th highest daily O3 concentrations were above the 120 µg/m³ threshold, implying values above the 2030 target value threshold. Please note that the legal definition of the target value considers not only 1 year but the average over 3 years.

O3 concentrations in 2024 in relation to the 2030 standard target value and number of stations considered for each country

Note: The graph is based, for each country, on the 95.07 percentile of the maximum daily 8-hour mean concentration values, corresponding to the 19th highest daily maximum of the running 8-hour mean in a complete time series. For each country, the number of stations considered for 2024 (in brackets) are given. The boxplot represents the lowest (bottom of the whisker), highest (top of the whisker) and average (black dot) values (in ..g/m³). The rectangles mark the 25th and 75th percentiles. At 25 % of the stations, levels are below the 25th percentile; at 25% of the stations, concentrations are above the 75th percentile. The target value threshold set for 2030 by the EU legislation is marked by the horizontal line. Please note that the legal definition of the target value considers not only 1 year but the average over 3 years. The graph should be read in relation to the above map, as a country's situation depends on the number of stations considered.

### 9.4 Status of NO<sub>2</sub> ambient air concentrations

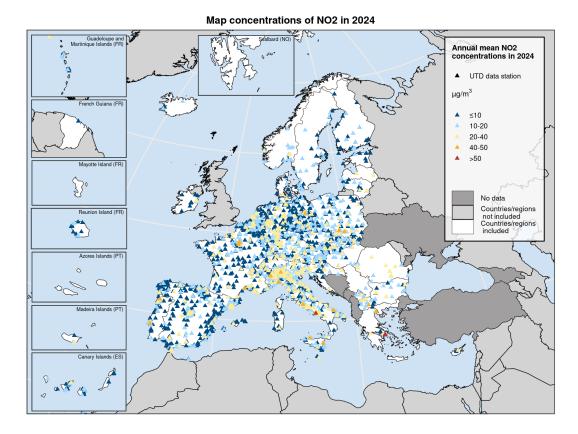

23 of the countries in EU-27 and 4 other reporting countries (Figure 40) recorded concentrations above the 2030 EU annual limit value (20  $\mu g/m^3$ ). This happened in 22 % (637 stations) of all the stations measuring NO<sub>2</sub>.

77 % (489 stations) of all values above the 2030 EU annual limit value were observed at traffic stations.

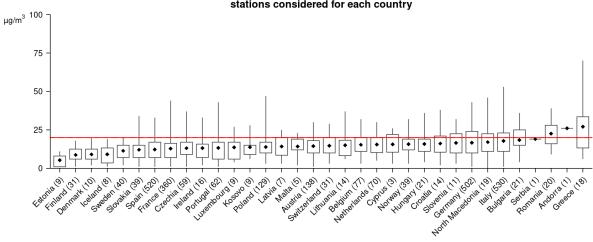

Concentrations above the 2030 EU  $NO_2$  daily limit value (50  $\mu$ g/m<sup>3</sup>, not to be exceeded more than 18 days per year) were reported in 5 % (139 stations) of all the reporting stations in 20 of the countries in EU-27 and 2 other reporting countries (Figure 41).

Finally, concentrations above the hourly limit value ( $200 \,\mu\text{g/m}^3$ , not to be exceeded more than 3 hours per year) were observed in 0.8 % ( $23 \, \text{stations}$ ) of all reporting stations, mostly at urban traffic stations. They were observed in eight countries (number stations): Italy (fourteen), Latvia (two), Spain (two), Belgium (one), Germany (one), Ireland (one), Slovakia (one) and Sweden (one).

Figure 40: UTD Map and Boxplot of NO<sub>2</sub> concentrations in 2024 - 2030 annual limit value

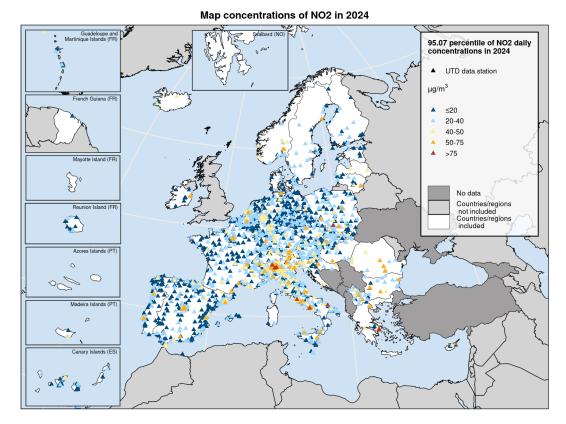

Note: Observed concentrations of NO2 in 2024. The last three colour categories indicate stations reporting concentrations above the 2030 EU annual limit value (20 µg/m³). Only stations with more than 75 % of valid data have been included in the map.

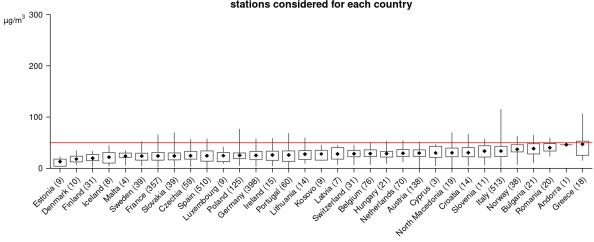

NO2 concentrations in 2024 in relation to the 2030 standard annual limit value and number of stations considered for each country

Note: The graph is based on annual mean concentration values. For each country, the number of stations considered for 2024 (in brackets) are given. The boxplot represents the lowest (bottom of the whisker), highest (top of the whisker) and average (black dot) annual mean values (in µg/m³). he rectangles mark the 25th and 75th percentiles. At 25 % of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations are above the 75th percentile. The annual limit value set by EU legislation for 2030 is marked by the continuous horizontal line. The graph should be read in relation to the above map, as a country's situation depends on the number of stations considered.

Figure 41: UTD Map and boxplot of NO<sub>2</sub> concentrations in 2024 - 2030 daily limit value

Note: The figure shows observed concentrations of NO2 in 2024. The map shows the 95.07 percentile of the NO2 daily mean concentrations, representing the 19th highest value in a complete series. It is related to the 2030 NO2 daily limit value, allowing 18 exceedances of the 50 µg/m³ threshold over 1 year. The last two colour categories indicate stations with concentrations above this daily limit value. Only stations with more than 75 % of valid data have been included in the map.

NO2 concentrations in 2024 in relation to the 2030 standard daily limit value and number of stations considered for each country

Note: The graph is based on the 95.07 percentile of daily mean concentration values corresponding to the 19th highest daily mean in complete ne series. For each country, the number of stations considered for 2024 (in brackets) are given. The boxplot represents the lowest (bottom of the whiske highest (top of the whisker) and average (black dot) 95.07 percentile values (in µg/m³). The rectangles mark the 25th and 75th percentiles. At 25% of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations are above the 75th percentile. The daily limit value EU legislation for 2030 is marked by the horizontal line. The graph should be read in relation to the above map, as a country's situation depends on the r of stations considered.

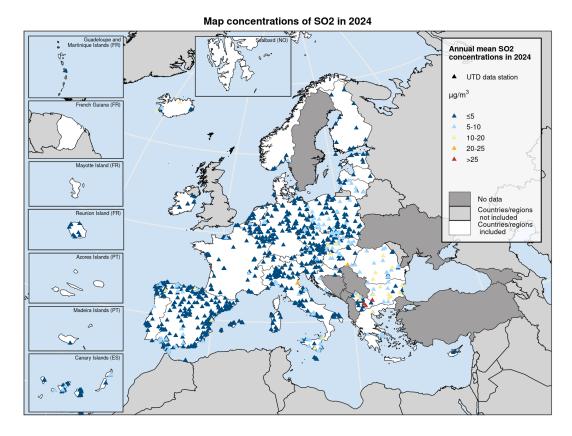

### 9.5 Status of SO<sub>2</sub> concentrations

3 of the countries in EU-27 and 1 other reporting countries (Figure 42) recorded concentrations above the 2030 EU annual limit value (20  $\mu g/m^3$ ). This happened in 0.4 % of all the stations measuring  $SO_2$ .

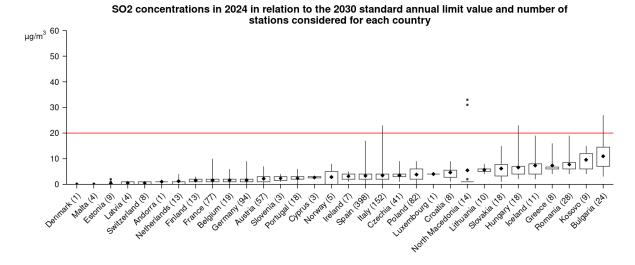

Concentrations above the 2030 EU  $SO_2$  daily limit value (50  $\mu$ g/m<sup>3</sup>, not to be exceeded more than 18 days per year) were registered in 1 % (6 stations) of all the reporting stations in 3 of the countries in EU-27 and 2 other reporting countries (Figure 43).

Finally, concentrations above the hourly limit value (350  $\mu$ g/m³ not to be exceeden in more than 3 ocassions) were observed in 2.1 % (24 stations) of all reporting stations. They were observed in eight countries (number stations): Italy (twelve), Czechia (four), Bulgaria (two), Iceland (two), Austria (one), France (one), Germany (one) and North Macedonia (one).

Figure 42: UTD Map and Boxplot of  $\mathrm{SO}_2$  concentrations in 2024 - 2030 annual limit value

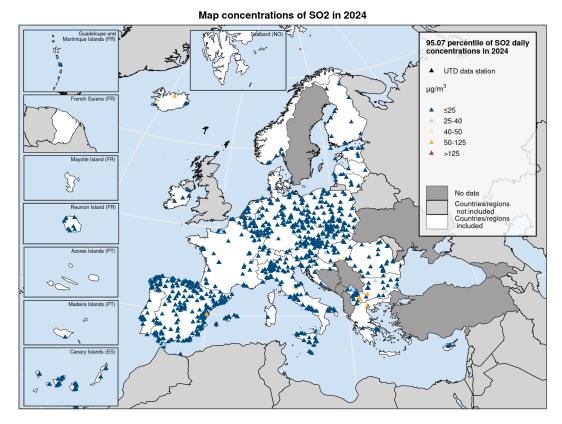

Note: Observed concentrations of SO2 in 2024. The last two colour categories indicate stations reporting concentrations above the 2030 EU annual limit value (20 µg/m³). Only stations with more than 75 % of valid data have been included in the map.

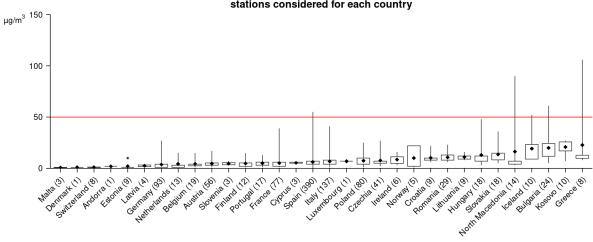

Note: The graph is based on annual mean concentration values. For each country, the number of stations considered for 2024 (in brackets) are given. The boxplot represents the lowest (bottom of the whisker), highest (top of the whisker) and average (black dot) annual mean values (in µg/m³). The rectangles mark the 25th and 75th percentiles. At 25 % of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations

are above the 75th percentile. The annual limit value set by EU legislation for 2030 is marked by the continuous horizontal line. The graph should be read in relation to the above map, as a country's situation depends on the number of stations considered.

Figure 43: UTD Map and boxplot of SO<sub>2</sub> concentrations in 2024 - 2030 daily limit value

Note: The figure shows observed concentrations of SO2 in 2024. The map shows the 95.07 percentile of the SO2 daily mean concentrations, representing the 19th highest value in a complete series. It is related to the 2030 SO2 daily limit value, allowing 18 exceedances of the 50 µg/m³ threshold over 1 year. The last two colour categories indicate stations with concentrations above this daily limit value. Only stations with more than 75 % of valid data have been included in the map.

SO2 concentrations in 2024 in relation to the 2030 standard daily limit value and number of stations considered for each country

Note: The graph is based on the 95.07 percentile of daily mean concentration values corresponding to the 19th highest daily mean in complete ne series. For each country, the number of stations considered for 2024 (in brackets) are given. The boxplot represents the lowest (bottom of the whiske highest (top of the whisker) and average (black dot) 95.07 percentile values (in µg/m³). The rectangles mark the 25th and 75th percentiles. At 25% of the stations, levels are below the 25th percentile; at 25 % of the stations, concentrations are above the 75th percentile. The daily limit value set by EU legislation for 2030 is marked by the horizontal line. The graph should be read in relation to the above map, as a country's situation depends on the number of stations considered.
